

Diwan Hamdan — QA Technical Review

ديوان حمدان · Technical System Review · Sprint Q1 2026

Reporting to: Mr.Rashid
Test Period: 10 Feb – 11 Feb 2026
Device: iPhone 13 Pro Max
Strategy: Technical System Review
Reviewer: Haitham

RELEASE BLOCKED — NO GO DECISION

5 systemic failures identified across People mapping, Events pipeline, Singers DB sync, Onboarding, and Search rendering. The People sub-category is **100% unmapped**. All 19 Events show critical threshold violations. The Singers pipeline has **45+ songs missing** across 22 of 28 tested performers. These must be resolved before any public release.

MODULES TESTED

MODULE HEALTH ANALYSIS

People Sub-Category

الشخصيات – Icons & Legacy

CRITICAL RISK

Pass	0
Fail	8
Partial	0

- **All 8 personalities are unmapped.** حمدان, محمد بن زايد, محمد بن راشد, زايد خليفة, راشد بن سعيد, سلطان قابوس, سلمان — none render correctly.
- **Root cause is DB-level.** Entity-to-category mapping table is either missing or not populated. This is not a UI bug — the data pipeline never linked person IDs to carousel entries.
- All portrait assets likely exist; the failure is purely the mapping layer between DB entities and carousel rendering logic.

Business Impact: The Poet Prince himself (حمدان بن محمد) does not appear in his own poetry app's People

Events Sub-Category

الأحداث – National Celebrations

CRITICAL RISK

Pass	0
Critical	19
Partial	0

- **All 19 events are Critical.** اليوم الوطني, يوم الشهيد, رمضان, الحج, عيد الفطر — every event category shows only 1/3 of expected poems.
- **Threshold rule is breached.** The "minimum 10 mentions" eligibility rule is being violated — events appear in the UI but the DB filter is not applying correctly, returning ~33% of content.
- Root cause is likely a **broken pagination or WHERE filter** in the events carousel query — a single SQL bug affects all 19 events simultaneously.

A single query bug affects the entire Events module. Fix is likely one SQL change — high ROI fix.

section. Highest severity for a cultural product of this profile.

Singers DB Pipeline

CRITICAL RISK

المؤدون – Song-to-Poem Mapping

- 45+ songs missing across 22 of 28 tested performers. محمد عبده alone has 10 unmapped songs.
- نبيل شعيل & عيضة المنهالي: Numerous confirmed songs not found in DB at all — likely ingestion was never run for these artists.
- 6 singers fully pass (أسماء لمنور, أبو بكر سالم, أريام, عباس) — indicating the pipeline works correctly when data exists.
- Root cause is **incomplete data ingestion**, not a code bug. The missing songs were never loaded into the songs table.

A data completeness problem, not an engineering bug. Requires a full audit of the songs DB against confirmed discographies.

Search Results UI

WARNING

نتائج البحث – Rendering & Display

- Semantic match % shows 135% and 115% (تطابق دلالي). Cosine similarity scores are not capped at 1.0 before display multiplication. Frontend is rendering raw floating-point values without normalization.
- Expanded query shown instead of original. The N8N-expanded context_query is passed back to the UI as the search term, confusing users who typed a simple phrase but see a verbose AI expansion.
- AI Analysis box renders correctly with gradient border, strict RTL alignment, and UAE flag emoji.
- Tab switching (تطابق نصي ↔ تطابق دلالي) is smooth with correct active state styling.

SR-01 fix is a one-line frontend cap: $\min(\text{score}, 1.0) \times 100$. SR-05 fix requires passing original query separately from context_query in the API response.

Places Sub-Category

WARNING

الأماكن – Land & Heritage

- 9 of 11 place categories unmapped. All of: الأماكن المجردة, المواقع الاجتماعية, الأراضي الإماراتية, قصر زعبل, البلاد, show الطبيعة العامة, المواقع الدينية, المواقع النبطية, المعالم الإماراتية Partial/unmapped.
- الأعضاء والجوارح & تجليات الزمن have no images AND are unmapped — two-layer failure.
- البحر (Sea) shows 11 records but the data is suspect — "الشعر بحر" (poetry is a sea) is triggering false positive animal classification.

Same root cause as People: the place sub-category mapping table is not populated. One pipeline fix covers all 9 partial entries.

Religion Sub-Category

WARNING

الدين – Faith & Devotion

- 4 of 7 religion sub-categories unmapped: الأماكن المقدسة, المناسبات الدينية, الكتب المقدسة, المفاهيم الإيمانية all fail to render content.
- الله, الأنبياء, and الاقتباسات الدينية render correctly — the mapping infrastructure exists and works for 3 categories.
- Pattern consistent with other sub-categories: the mapping exists for high-priority/obvious items (الله, الأنبياء) but was never extended to the remaining 4.

Partial mapping proves the system works. Completing the remaining 4 entries is a data task, not an engineering task.

Home Carousels & Navigation

HEALTHY

الرئيسية، القائمة الجانبية

Pass		10
Fail		1
Partial		2

- Image aspect ratios preserved across all 112 artwork cards handled manually — visual quality is high.
- RTL swipe on carousels is smooth; small thumbnails snap correctly; top carousel flawless.
- Arabic grammar for titles (usage of ال) handled programmatically and correctly.
- Side menu has redundant "السجل" while "recent searches" already serves the same purpose — causes UX confusion.
- Singer song counts Partial — HC-02 shows counts don't match DB (detailed in Singers module).

The most polished module. The 112 manually-handled artworks show high attention to visual quality. Remaining issues are data-driven, not design-driven.

Data Normalization & Pipeline

HEALTHY

معالجة البيانات – Arabic NLP

Pass		4
Fail		0
Unknown		1

- Alif variants (أ/إ/إي) all normalize correctly to 'ي'. ى correctly preserved as distinct characters.
- Tashkeel (diacritics) and Tatweel (-) fully stripped from _cleaned columns — no false negatives in search.
- DB integrity confirmed: 4,213 lines across 353 poems. JSONB arrays well-formed. No scalar resolved_from issues remaining.
- Auto-ingest pipeline status unknown. Currently appears to be manual SQL — no automated ingestion confirmed.

The strongest technical foundation in the project. Past bugs (إ→ي collapse, Row 194 scalar crash) have been resolved. The normalization layer is production-ready.

CRITICAL ISSUES — REQUIRES IMMEDIATE FIX

BUG-CRIT-01 People Sub-Category — 100% Unmapped (All 8 Personalities)

All 8 personality entries (حمدان بن محمد, محمد بن زايد, محمد بن راشد, زايد بن سلطان, خليفة بن زايد, راشد بن سعيد, سلطان قابوس, سلمان) fail to render. The entity-to-carousel mapping table was never populated. The carousel exists in the UI, but the DB query returns zero results for every person.

⚡ Critical Impact: The Poet Prince himself does not appear in his own app's People section. Unacceptable for a product of this cultural significance. Blocks release entirely.

BUG-CRIT-02 Events Carousel — All 19 Events Show Only 1/3 of Expected Content

Every event (عيد الفطر, الحج, رمضان, يوم الشهيد, اليوم الوطني, and 14 others) violates the "minimum 10 mentions" threshold and displays approximately one-third of expected poems. Root cause is likely a single broken SQL WHERE clause or pagination bug in the events carousel query that applies to all events simultaneously.

⚡ Critical Impact: Time-sensitive content (رمضان, اليوم الوطني) will be visibly incomplete during the most important cultural moments. One SQL fix likely resolves all 19.

BUG-CRIT-03 Singers Pipeline — 45+ Songs Missing Across 22 Artists

ميحد حمد (8), راشد الماجد (6), عبدالمجيد عبدالله, نبيل شعيّل (10 missing), محمد عبده (4). The pipeline works correctly for 6 singers, confirming the architecture is sound — but data ingestion was never completed for the majority of the roster.

⚡ **Critical Impact:** The Singers feature (المؤدون) is the app's key multimedia differentiator. Launching with 45+ missing songs creates immediate negative user reviews.

BUG-CRIT-04 Semantic Score Displays Impossible Values (135%, 115%)

The تطابق دلالي (Semantic Match) percentage badges display values above 100%. The cosine similarity score from OpenAI embeddings (range: 0.0–1.0) is being multiplied by 100 without first being clamped. Fix: apply $\text{Math.min}(\text{score}, 1.0) * 100$ before rendering.

⚡ **Critical Impact:** Destroys user trust immediately. A user seeing "135% match" perceives the app as broken or untrustworthy before reading a single poem.

BUG-HIGH-01 Search Shows Expanded Query Instead of User's Original Query

When a user types "الشوق", the search result header displays the N8N-expanded context_query (e.g. "قصائد عن الشوق والحنين والفرق") instead of the original "الشوق". The original query string is not being preserved separately in the API response before AI expansion replaces it.

⚠ **High Impact:** Breaks the fundamental search UX contract — what you type is not what you see. Confusing for all users, especially non-technical.

BUG-HIGH-02 البحر (Sea) Category Contains False Positives — "الشعر بحر" Misclassified

The Sea animal sub-category shows 11 records when fewer are expected. The metaphorical Arabic phrase "الشعر بحر" (poetry is a sea) is triggering the animals classification for Sea, as the AI metadata extraction is not distinguishing between literal and metaphorical uses of "بحر".

⚠ **High Impact:** Degrades content quality in the animals section. Requires refining the AI extraction prompt to distinguish literal from figurative use.

PROCESS-COOP-01 Team Cooperation — Process Observations & Recommendations

Observation (Process): Mobile and Backend teams exhibited strong collaboration and adaptability. However, Design Team repeatedly enforced a premature design freeze and forwarded artifacts to Mobile without formal architecture validation or sign-off, causing requirements drift.

Impact (Scope / Quality / Delivery): Requirements drift, blocked API integrations (hardcoded samples), missing/mismatched pages, and 52 bug reports raised to realign the product. This increased technical debt, delayed validation, and created avoidable team friction.

Root Cause (Governance): Lack of an enforced *Design→Architecture Validation Gate*, missing RACI sign-offs, and absent requirements traceability.

Recommendations:

- 1. Introduce an enforced Design–Architecture Validation Gate (design proposal → architecture review → PO sign-off).
- 2. Apply RACI to design approvals and require documented sign-offs in PRs/change logs.
- 3. Time-box iterative prototyping before any design freeze (e.g., 2 iterations).
- 4. Prohibit hardcoded API samples in acceptance builds; use traceable feature flags or mocks.
- 5. Link design artifacts to acceptance criteria via a traceability matrix.
- 6. Log integration risk in the risk register and reflect rework in sprint planning.
- 7. Hold a cross-functional retrospective and update the Definition of Done (DoD).

SINGERS PIPELINE DETAIL & CONTENT MAPPING HEALTH

Singers DB Sync — المؤدّون		21% Pass · 28 Tested
محمد عبده (Mohammed Abdu)	10 songs missing	Critical
نبيل شعيل (Nabeel Shuail)	Numerous not in DB	Critical
ميحد حمد (Mehad Hamad)	8 songs missing	Fail
راشد الماجد (Rashid Al Majid)	6 songs missing	Fail
عبدالمجيد عبدالله (Abdul Majeed)	4 songs missing	Fail
حسين الجسمي (Hussein Al Jassmi)	2 songs missing	Fail
كاظم الساهر · بلقيس · الوسمي	1 each missing	Fail
عيضة المنهالي · أطفال الإمارات	1+ numerous	Fail
أسماء لمنور · أبوبكر سالم · أريام		Pass
عباس إبراهيم · فايز السعيد · خالد ع		Pass

Content Mapping Health by Category		Sub-Category Status	
المشاعر (Sentiments)		100%	13/13 Pass
المواضيع (Subjects)		90%	9/10 Pass
الفئات الرئيسية (Main Cat.)		100%	7/7 Pass
الدين (Religion)		43%	3/7 · 4 unmapped
المخلوقات (Animals)		38%	Mixed + false pos.

RELEASE RECOMMENDATION

🚫 RELEASE BLOCKED — Critical Issues Must Be Resolved

The Q1 2026 release cannot proceed. 5 of 8 tested modules have Critical or Warning status. The core content discovery experience (People, Events, Places) is severely degraded due to systematic mapping failures. The Singers feature has incomplete data for 79% of tested artists. Semantic scores display logically impossible values, destroying user trust before engagement begins.

- Populate People entity-to-carousel mapping table for all 8 personalities (PPL-01 through PPL-08) — data task, 1-2 days
- Debug Events carousel SQL — single WHERE clause or pagination bug causing 1/3 content display across all 19 events — engineering task, 1 day
- Complete Singers DB ingestion audit — run full discography check against DB for 22 affected artists, especially **نبييل شعيل** and **محمد عبده**
- Cap semantic similarity score: $\text{Math.min}(\text{score}, 1.0) \times 100$ before rendering **تطابق دلالي** — frontend fix, 30 minutes
- Preserve original query string in API response separately from context_query — backend fix, 1 hour
- Populate remaining Places (9 entries), Religion (4 entries) mapping data
- Review **البحر** classification — add literal/metaphorical disambiguation to AI extraction prompt

Estimated Fix Time: 5–7 business days for Critical items

Retest Required: All modules after fixes

Revised Target: Re-evaluate after Critical items resolved
